LAB REPORT

ON

MACHINE LEARNING

Submitted by:

MAHAVIR NAHATA (1BM21CS100)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU-560019

March 2024-June 2024

B. M. S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled "**MACHINE LEARNING**" carried out by **MAHAVIR NAHATA(1BM21CS100),** who is bonafide student of **B. M. S. College of Engineering.** It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2023-24. The Lab report has been approved as it satisfies the academic requirements in respect of Machine Learning Lab **- (22CS3PCMAL)** work prescribed for the said degree.

Sunayana S
Assistant Professor

PROGRAM 1

Date:05-04-2024

Write a python program to import and export data using Pandas library functions

05/04/24

Program -1

Write a python program to import and export data using Pandas library functions

IMPORT:

```
import pandas as pd
airbnb_data = pd.read_csv ("listings.csv")
airbnb_data.head()
```

EXPORT:

```
airbnb_data.to_csv ("exported_listings.csv")
```

READING DATA FROM URL:

```
url = "https://archive.ics.uci.edu/ml/machine-learning
        -databases/iris/iris.data"
col_names = ["sepal_length_in_cm", "sepal_width_
            in_cm", "petal_length_in_cm",
            "petal_width_in_cm", "class"]
iris_data = pd.read_csv (url, names= col_names)
iris_data.head()
```

Import:

```
import pandas as pd
# Read the CSV file
airbnb_data = pd.read_csv("listings.csv")
# View the first 5 rows
airbnb_data.head()
```

	id	name	host_id	host_name	neighbourhood_group	neighbourhood	latitude	longitude	room_type	price	minimum_nights	number_of_reviews	last_r
0	329172	Hillside designer home,10 min.dwntn	1660871	Janet	NaN	78746	30.30085	-97.80794	Entire home/apt	495	3	7	2022-

PROGRAM 2

Date:05-04-2024

Demonstrate various data pre-processing techniques for a given dataset

Code and Output

2. Importing and Exploration of the dataset

In [1]:
```
# Loading the data and setting the unique client_id as the index::

df = pd.read_csv('/content/loans.csv', index_col = 'client_id')
```

In [3]:
```
# # showing the first 5 rows of the dataset:
df.head()
```

Out[3]:

client_id	loan_type	loan_amount	repaid	loan_id	loan_start	loan_end	rate
46109	home	13672	0	10243	2002-04-16	2003-12-20	2.15
46109	credit	9794	0	10984	2003-10-21	2005-07-17	1.25
46109	home	12734	1	10990	2006-02-01	2007-07-05	0.68
46109	cash	12518	1	10596	2010-12-08	2013-05-05	1.24
46109	credit	14049	1	11415	2010-07-07	2012-05-21	3.13

In [4]:
```
# To check the Dimensions of the dataset:
df.shape
```

Out[4]: (443, 7)

In [5]:
```
# Checking the info of the data:
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
Index: 443 entries, 46109 to 26945
Data columns (total 7 columns):
 #   Column       Non-Null Count  Dtype
---  ------       --------------  -----
 0   loan_type    443 non-null    object
 1   loan_amount  443 non-null    int64
 2   repaid       443 non-null    int64
 3   loan_id      443 non-null    int64
 4   loan_start   443 non-null    object
 5   loan_end     443 non-null    object
 6   rate         443 non-null    float64
dtypes: float64(1), int64(3), object(3)
memory usage: 27.7+ KB
```

3. Checking the datatypes of the columns

In [6]:
```
df.dtypes
```

Out[6]:
```
loan_type       object
loan_amount      int64
repaid           int64
loan_id          int64
loan_start      object
loan_end        object
rate           float64
dtype: object
```

4. Converting the data types of columns

```
- loan_id to object
- repaid to category dtype
- loan_start and loan_end to date type
```

In [7]:
```
# loan_id:

df['loan_id'] = df['loan_id'].astype('object')

# repaid:

df['repaid'] = df['repaid'].astype('category')
```

In [8]:
```
# loan_start:

df['loan_start'] = pd.to_datetime(df['loan_start'], format = '%Y-%m-%d')

# loan_end:

df['loan_end'] = pd.to_datetime(df['loan_end'], format = '%Y-%m-%d')
```

Checking the datatypes again:

In [9]:
```
df.dtypes
```

Out[9]:
```
loan_type              object
loan_amount             int64
repaid               category
loan_id                object
loan_start     datetime64[ns]
loan_end       datetime64[ns]
rate                  float64
dtype: object
```

5. Summary Statistics of the data

In [10]:
```
# Summary Statistics for Numerical data:
df.describe()
```

Out[10]:

	loan_amount	loan_start	loan_end	rate

max	NaN	NaN	NaN	2014-11-11 00:00:00	2017-05-07 00:00:00

6. Missing Values

In [12]:

```python
# use isnull().sum() to check for missing values
df.isnull().sum()
```

Out[12]:

```
loan_type      0
loan_amount    0
repaid         0
loan_id        0
loan_start     0
loan_end       0
rate           0
dtype: int64
```

There are no missing values in the data.

Sk-learn library has an in-built function called Iterative Imputer to impute the missing values. Its sklearn domcumentation: https://scikit-learn.org/stable/modules/generated/sklearn.impute.IterativeImputer.html

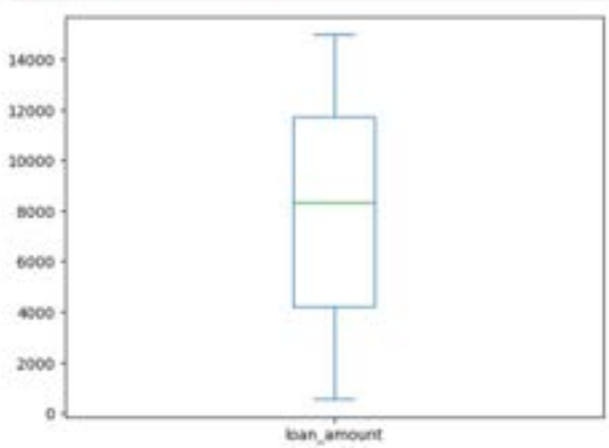
---

7. Outliers Treatment

To check for the presence of outliers, we plot Boxplot.

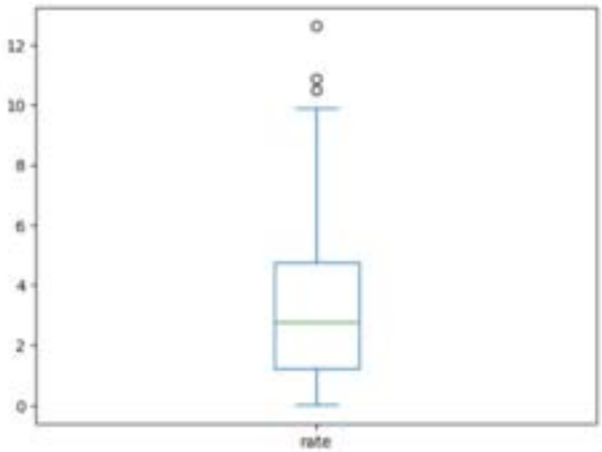
In [13]:

```python
# For loan_amount
df['loan_amount'].plot(kind='box')
plt.show()
```



In [14]:

```
# For rate
df['rate'].plot(kind='box')
plt.show()
```



We can see that there are no outliers in the loan_amount column and some outliers are present in the rate column. To treat for outliers can either cap the values or transform the data. Shall demonstrate both the approaches here.

8. Transformation

8a. SQRT transformation

In [15]:

```
df['SQRT_RATE'] = df['rate']**0.5
```

In [16]:

```
df['sqrt_rate'] = np.sqrt(df['rate'])
```

In [17]:

```
df.head()
```

Out[17]:

client_id	loan_type	loan_amount	repaid	loan_id	loan_start	loan_end	rate	SQRT_RATE	sqrt_rate
46109	home	13672	0	10243	2002-04-16	2003-12-20	2.15	1.466288	1.466288
46109	credit	9794	0	10984	2003-10-21	2005-07-17	1.25	1.118034	1.118034
46109	home	12734	1	10990	2006-02-01	2007-07-05	0.68	0.824621	0.824621
46109	cash	12518	1	10596	2010-12-08	2013-05-05	1.24	1.113553	1.113553
46109	credit	14049	1	11415	2010-07-07	2012-05-21	3.13	1.769181	1.769181

```python
#checking the skewness, kurtosis between the original and transformed data:
print("The skewness of the original data is {}".format(df.rate.skew()))
print("The skewness of the SQRT transformed data is {}".format(df.SQRT_RATE.skew()))

print('')

print("The kurtosis of the original data is {}".format(df.rate.kurt()))
print("The kurtosis of the SQRT transformed data is {}".format(df.SQRT_RATE.kurt()))
```

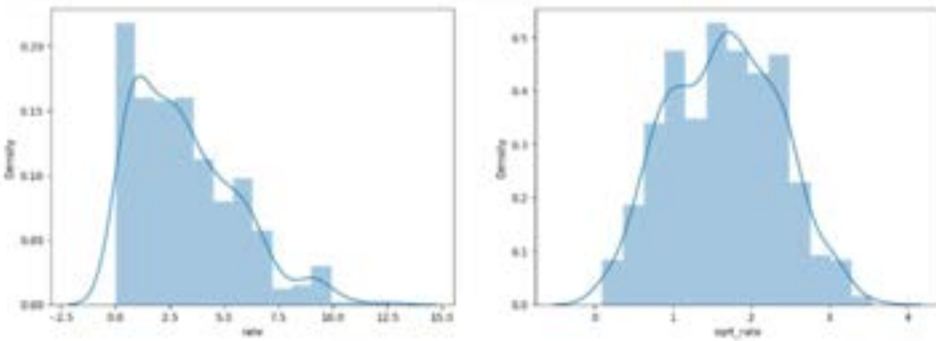
```
The skewness of the original data is 0.884284614329943
The skewness of the SQRT transformed data is 0.04564154085520861

The kurtosis of the original data is 0.42437165143736433
The kurtosis of the SQRT transformed data is -0.6318437642063839
```

```python
# plotting the distribution

fig, axes = plt.subplots(1,2, figsize=(15,5))
sns.distplot(df['rate'], ax=axes[0])
sns.distplot(df['sqrt_rate'], ax=axes[1])

plt.show()
```



Result:

The Rate column was right skewed earlier. The skewness and kurtosis as reduced significantly. The transformed SQRT rate, on the right graph resembles normal distribution now.

8b. Log Transformation

```python
df['Log Rate'] = np.log(df['rate'])
```

```python
df.head()
```

client_id	loan_type	loan_amount	repaid	loan_id	loan_start	loan_end	rate	SQRT_RATE	sqrt_rate	Log Rate
46109	home	13672	0	10243	2002-04-16	2003-12-20	2.15	1.466288	1.466288	0.765468
46109	credit	9794	0	10984	2003-10-21	2005-07-17	1.25	1.118034	1.118034	0.223144
46109	home	12734	1	10990	2006-02-01	2007-07-05	0.68	0.824621	0.824621	-0.385662
46109	cash	12518	1	10596	2010-12-08	2013-05-05	1.24	1.113553	1.113553	0.215111
46109	credit	14049	1	11415	2010-07-07	2012-05-21	3.13	1.769181	1.769181	1.141033

```python
print("The skewness of the original data is {}".format(df.rate.skew()))
print("The skewness of the SQRT transformed data is {}".format(df.SQRT_RATE.skew()))
print("The skewnss of the LOG transformed data is {}".format(df['Log Rate'].skew()))

print('')

print("The kurtosis of the original data is {}".format(df.rate.kurt()))
print("The kurtosis of the SQRT transformed data is {}".format(df.SQRT_RATE.kurt()))
print("The kurtosis of the LOG transformed data is {}".format(df['Log Rate'].kurt()))
```

```
The skewness of the original data is 0.884284614329943
The skewness of the SQRT transformed data is 0.04564154085520861
The skewnss of the LOG transformed data is -1.5943117626331892

The kurtosis of the original data is 0.42437165143736433
The kurtosis of the SQRT transformed data is -0.6318437642063839
The kurtosis of the LOG transformed data is 4.157831586036328
```

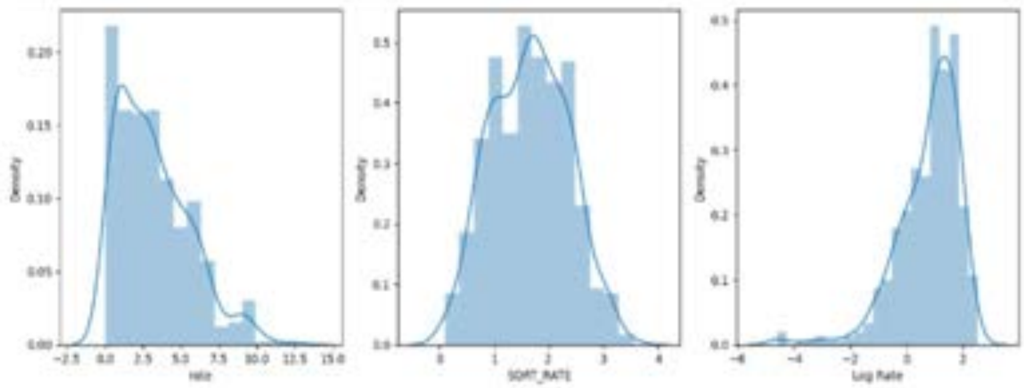
In [23]:

```python
# plot the graph:

fig, axes = plt.subplots(1,3,figsize=(15,5))

sns.distplot(df['rate'], ax=axes[0])
sns.distplot(df['SQRT_RATE'], ax=axes[1])
sns.distplot(df['Log Rate'], ax=axes[2])

plt.show()
```



Inference:

Log Transformation made the rate left skewed and more peaked.

However, Log transformation is more closer to 0 and hence is more normal. Though it heavily maniupulates the data.

In our case, square root transformation is more suitable.

In [24]:

```python
## using Lambda function :

df['LOG_Rate'] = df['rate'].apply(lambda x:np.log(x))
```

In [25]:

```python
df.head()
```

Out[25]:

46109	credit	14049	1	11415	2010-07-07	2012-05-21	3.13	1.769181	1.769181	1.141033	1.141033

PROGRAM 3

Date:12-04-2024

Use an appropriate data set for building the decision tree (ID3) and apply this knowledge to classify a new sample

Algorithm:

12/04/24

Program - 2
Decision Tree ID3

Algorithm:

ID3 (Examples , Target attribute , Attributes)
- Create a Root node for the tree
- ~~Retu~~ If all Examples are positive, Return the single-node tree Root, with label = +
- If all Examples are negative, Return the single-node tree Root, with label = -
- If attributes is empty, Return the single-node tree Root, with label = most common value of Target-attribute in Examples
- Otherwise Begin :
  - A ← the attribute from Attributes that best* classifies Examples.
  - The decision attribute for Root ← A.
  - For each possible value, v_i, of A,
    - Add a new tree branch below Root, corresponding to the test A = v_i
    - Let $Examples_{v_i}$, be the subset of Examples that have values v_i for A.
    - If $Examples_{v_i}$ is empty.
      - Then below this new branch add a leaf node with label = most common value of Target_attribute
    - Else below this new branch add the subtree ID3.
- End
- Return Root

Code:

Importing Database

```
In [2]:
# Importing the required libraries
import pandas as pd
import numpy as np

Slope and Intercept calculation

In [19]:
```
def linear(X, b0, b1):
    return [b0+b1*x for x in X]
```

In [20]:
```
# b0 - Intercept
def intercept(X, Y, b1):
    x_ = np.mean(X)
    y_ = np.mean(Y)

    return y_-b1*x_
```

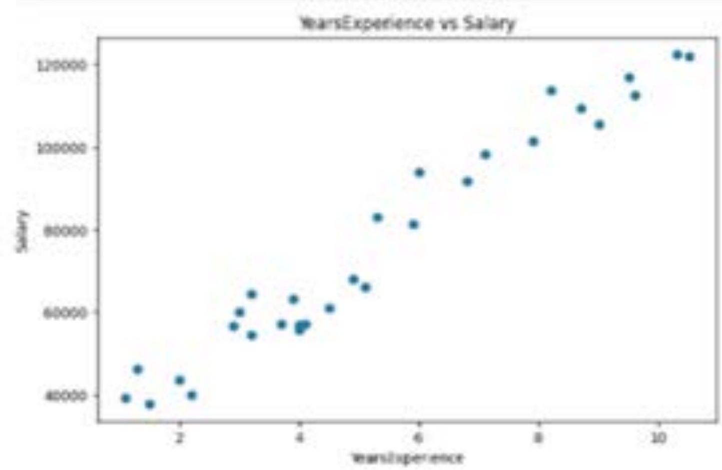
In [21]:
```
# b1 - Slope
def slope(X, Y):
    x_ = np.mean(X)
    y_ = np.mean(Y)

    rise = sum([(x-x_) * (y-y_) for x,y in zip(X,Y)])
    run = sum([(x-x_)**2 for x,y in zip(X,Y)])

    return rise / run
```

Predicted Values Graph

In [23]:
```
plt.figure(figsize=(8,5))
plt.title("YearsExperience vs Salary")
plt.scatter(predictor, target, color = "#247ba0")
plt.xlabel("YearsExperience")
plt.ylabel("Salary")
plt.show()
```



In [29]:
```
b1 = slope(predictor, target)
b0 = intercept(predictor, target, b1)
predicted = linear(predictor, b0, b1)
```

In [30]:
```
plt.figure(figsize = (8, 5))
plt.plot(predictor, predicted, color = "#f25f5c")
plt.scatter(predictor, predicted, color = "#f25f5c")  #Red line is predicted data
plt.title('Predicted values by Linear Regression', fontsize = 15)
plt.xlabel("YearsExperience")
plt.ylabel("Salary")
plt.scatter(predictor, target, color = "#247ba0")
plt.show()
```

Output

```
In [26]:
print("Coefficients:\n==============")
print("b0 : ", b0)
print("b1 : ", b1)
```

```
Coefficients:
=============
b0 :  25792.20019866869
b1 :  9449.962321455077
```

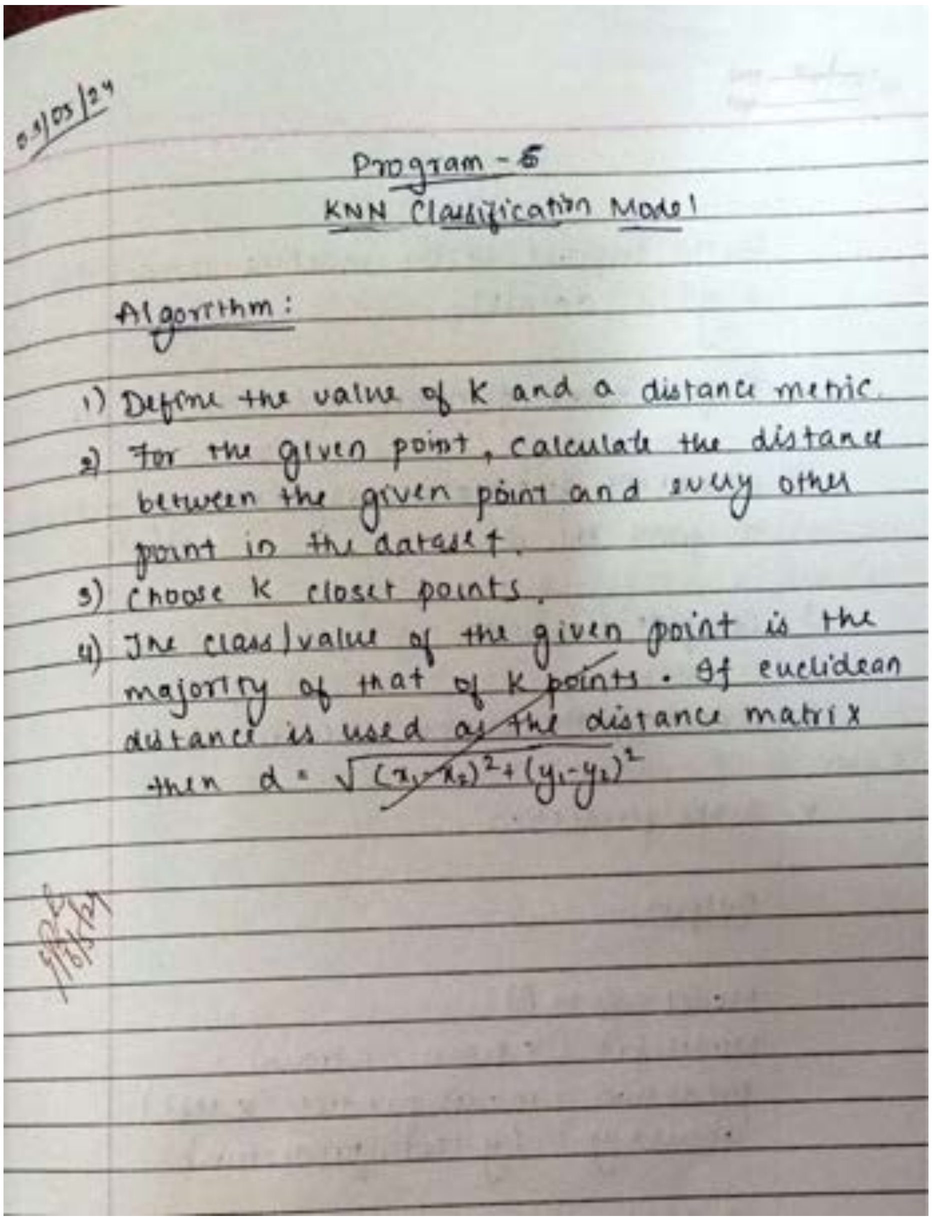
PROGRAM 6

Date:19-04-2024

Build KNN Classification model for a given dataset.

Algorithm



03/05/24

Program - 6

KNN Classification Model

Algorithm:

1) Define the value of K and a distance metric.
2) For the given point, calculate the distance between the given point and every other point in the dataset.
3) Choose K closest points.
4) The class/value of the given point is the majority of that of K points. If euclidean distance is used as the distance matrix then $d = \sqrt{(x_1-x_2)^2+(y_1-y_2)^2}$

PROGRAM 7

Date:24-05-2024

Build Support vector machine model for a given dataset

Algorithm

24/05/24

Program - 7

Build support vector machine model for a given dataset

1. Define kernel function $K(x_1, x_2) = x_1 \cdot x_2$
2. Solve the quadratic programming problem to find the α
3. Compute the bias
4. Identify the support vector
5. Make prediction

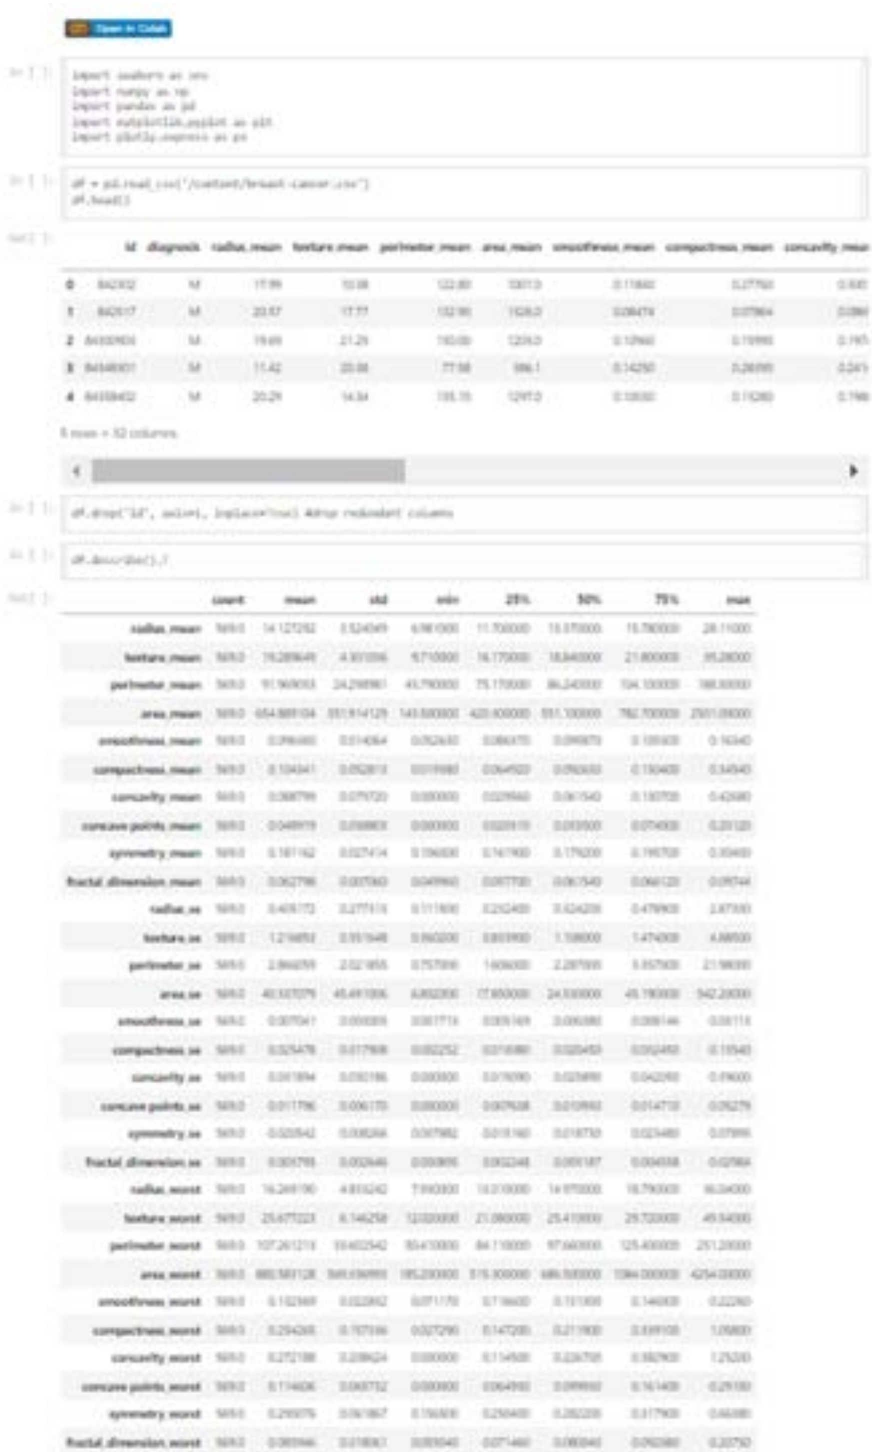
Output

```
Model = SVM ()
Model.fit (x_train , y_train)
prediction = model.predict (x_test)
accuracy = (y_test , prediction)

0.98230088

Model predict ( [-0.43096, -0.16048954,
                 -0.4481
                 -0.8244122, -0.19956318 ]]
```

Code



```python

PROGRAM 8

Date: 31-05-2024

Build Artificial Neural Network model with back propagation on a given dataset

Algorithm

31/5/24

Program 8

Build Artificial Neural Network model with back propagation on a given dataset.

Algorithm:

1. Create a feed-forward network with n_i inputs, n_{hidden} hidden units, and n_{out} output units.
2. Initialize all network weights to small random numbers.
3. Until the termination condition is met, Do
   - For each $(\vec{x}, \vec{t})$, in training examples, Do
     Propogate the input forward through the network:
     1. Input the instance $\vec{x}$, to the network and compute the output o_u of every unit u in the network.

     Propogate the errors backward through the network:

     2. For each network output unit k, calculate its error term δ_k
        $$\delta_k \leftarrow o_k(1-o_k)(t_k-o_k)$$
     3. For each hidden unit h, calculate its error term δ_h
        $$\delta_h \leftarrow o_h(1-o_h) \sum_{k \in outputs} w_{hk}\delta_k$$
     4. Update each network weight w_{ji}
        $$w_{ji} \leftarrow w_{ji} + \Delta w_{ji}$$
        where
        $$\Delta w_{ji} = \eta \delta_j x_{ij}$$

Output: Learning Accuracy = 0.66233, Testing Accuracy = 1.0

PROGRAM 9

Date: 31-05-2024

a) Implement Random forest ensemble method on a given dataset.

Algorithm

31/5/24

Program 9

(a) Implement Random forest ensemble method on a given dataset.

Algorithm:

1. Select Random K data points from the training dataset
2. Build the decision trees associated with the selected data points
3. Choose the number N for decision trees that you want to build.
4. Repeat step 1 & 2.
5. For new data points, find the predicti[on]s of each decision tree and assign the new data points to the category that wins the majority votes.

Output:

Mean Absolute Error: 3.92 degrees

Accuracy: 93.76%

b) Implement Boosting ensemble method on a given dataset.

Algorithm

(b) Implement Boosting Ensemble on a given dataset

Algorithm:

1. Initialize the dataset and assign equal weight to each of the data point.
2. Provide this as input to the model and identify the wrongly classified datapoints
3. Increase the weight of the wrongly classified data points and decrease the weights of correctly classified data points. And then normalize the weights of all data points.
4. If (got required results)
   Goto step-5
   Else
   Goto step-2
5. End.

Output

Confusion Matrix : [[116 35]
[26 54]]

Accuracy score : 0.7359.

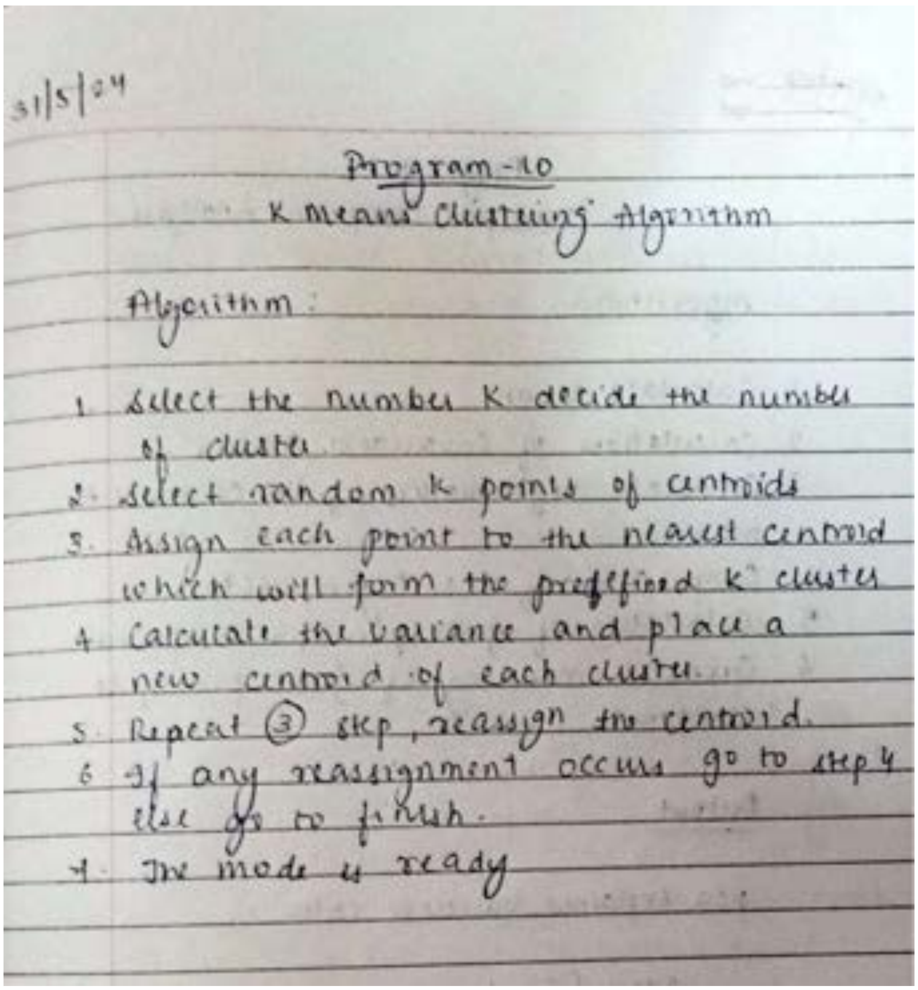
PROGRAM 10

Date: 24-05-2024

Build k-Means algorithm to cluster a set of data stored in a .CSV file.

Algorithm



31/5/24

Program-10

K Means Clustering Algorithm

Algorithm:

1. Select the number K decide the number of cluster
2. Select random k points of centroids
3. Assign each point to the nearest centroid which will form the predefined k clusters
4. Calculate the variance and place a new centroid of each cluster.
5. Repeat 3 step, reassign the centroid.
6. If any reassignment occurs go to step 4 else go to finish.
7. The mode is ready

Code

Importing and initializing the data points

In [5]:

```
import matplotlib.pyplot as plt
import numpy as np
from sklearn.cluster import KMeans
```

In [6]:

```
from sklearn.datasets import make_blobs
X, y_true = make_blobs(n_samples=150, centers=4, cluster_std=0.60, random_state=0)
```

In [7]:

```
import plotly.express as px
fig = px.scatter(x =X[:, 0], y =X[:, 1],width=800,height=500)
fig.show()
```

Elbow Method to find optimal K

In [8]:

```
cost =[]
for i in range(1, 11):
        KM = KMeans(n_clusters = i, max_iter = 500)
        KM.fit(X)

        cost.append(KM.inertia_)

# plot the cost against K values
fig = px.line(x=range(1, 11), y=cost, width=600, height=400)
fig.show()
# the point of the elbow is the
# most optimal value for choosing k
```

Defining Model and fitting the same

In [9]:

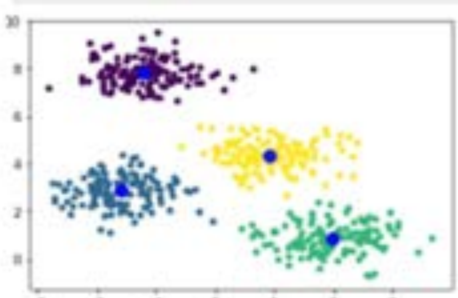
```
kmeans = KMeans(n_clusters=4)
kmeans.fit(X)
y_kmeans = kmeans.predict(X)
```

In [10]:

```
fig = px.scatter(x =X[:, 0], y = X[:, 1], color=y_kmeans, width=700,height=400)
trace = px.scatter(x =X[:, 0], y = X[:, 1],  width=700,height=400)
fig.show()
```

In [11]:

```
plt.scatter(X[:, 0], X[:, 1], c=y_kmeans, s=20)
centers = kmeans.cluster_centers_
plt.scatter(centers[:, 0], centers[:, 1], c='blue', s=100, alpha=0.9);
plt.show()
```



Iris Dataset

In [12]:
```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
from sklearn import datasets
```

In [14]:
```
iris = datasets.load_iris()
df = pd.DataFrame(iris.data)
df['class']=iris.target
df.columns=['sepal_len', 'sepal_wid', 'petal_len', 'petal_wid', 'class']
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 150 entries, 0 to 149
Data columns (total 5 columns):
 #   Column     Non-Null Count  Dtype

 2   petal_len  150 non-null    float64
 3   petal_wid  150 non-null    float64
 4   class      150 non-null    int64
dtypes: float64(4), int64(1)
memory usage: 6.0 KB
```

In [52]:
```
px.histogram(df, x ='class', color='class')
```

In [56]:
```
from sklearn.preprocessing import StandardScaler
scaler = StandardScaler()
X = df.iloc[:,0:4].values
```

In [63]:
```
scaled_x = scaler.fit_transform(X)
```

In [74]:
```
model = KMeans(n_clusters=3,init="k-means++",random_state=0)
labels = model.fit_predict(scaled_x)
```

In [84]:
```
import plotly.graph_objects as go
fig = go.Figure()

 # Add trace
fig.add_trace(go.Histogram(x=labels,name="Predicted Labels"))
fig.add_trace(go.Histogram(x=df['class'],name="True Labels"))

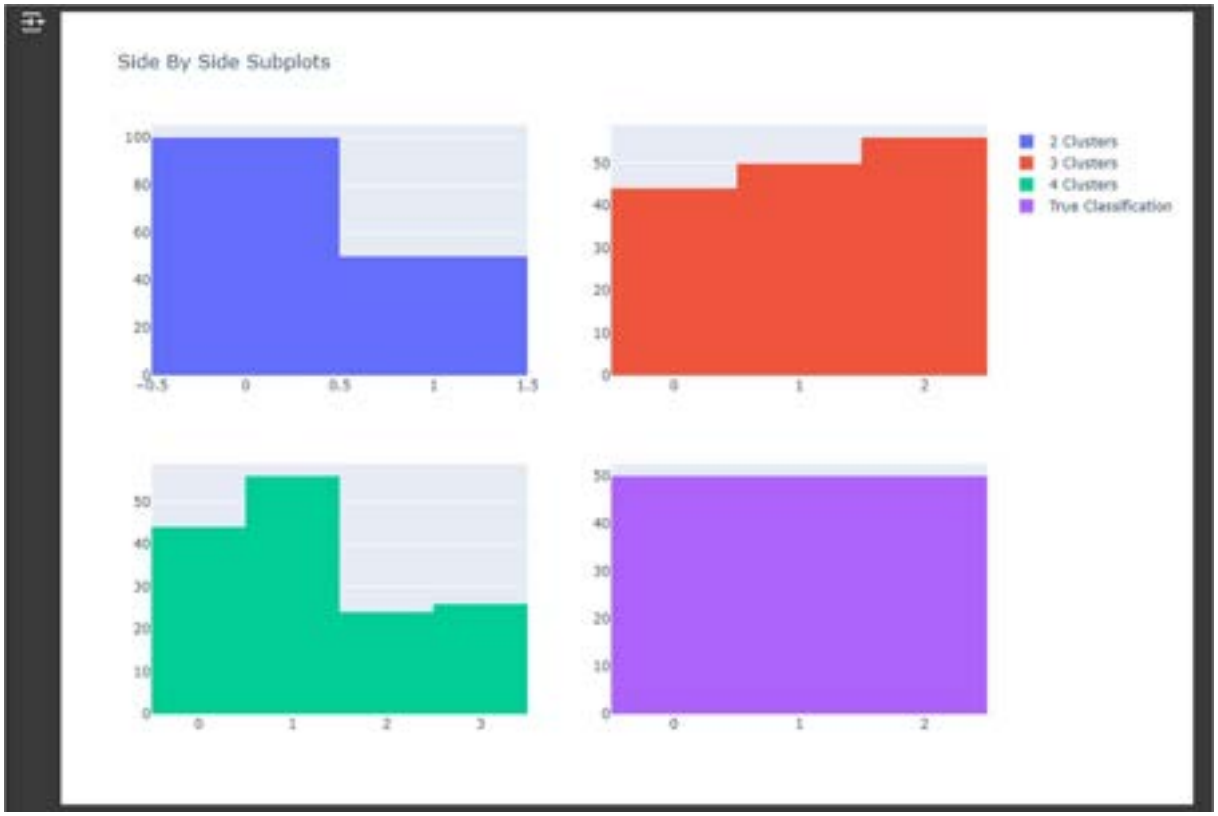
# Overlay both histograms
fig.update_layout(barmode='overlay')
# Reduce opacity to see both histograms
fig.update_traces(opacity=0.75)
fig.show()
```

In [89]:
```
labels =[]
for i in range(2, 5):
        model = KMeans(n_clusters = i, max_iter = 500)
        model.fit(scaled_x)
        labels.append(model.fit_predict(scaled_x))
```

In [97]:
```
from plotly.subplots import make_subplots
import plotly.graph_objects as go
fig = make_subplots(rows=2, cols=2)
for i in range(0, 3):
    fig.add_trace(go.Histogram(x=labels[i],name="{} Clusters".format(i+2)),
              row=(i//2 + 1), col=(i%2 + 1))
fig.add_trace(go.Histogram(x=df['class'],name="True Classification"),
              row=(2), col=(2))
fig.update_layout(height=700, width=1000, title_text="Side By Side Subplots")

fig.show()
```

Output



Side By Side Subplots
2 Clusters
3 Clusters
4 Clusters
True Classification

PROGRAM 11

Date: 24-05-2024

Implement Dimensionality reduction using Principle Component Analysis (PCA) method.

31/5/24

Program 11

Principal Component Analysis

Algorithm:

1. Calculate Mean.
2. Calculations of Covariance Matrix
3. Calculate Eigen values of the covariance matrix.
4. Computation of the Eigen vector.
5. Calculation of first principle component
6. Geometric meaning of first principle component.

Output:

pca.explained_variance ratio

array([0.9837746, 0.01620498])
